Second Order Linear Differential Equations

In this chapter we will start looking at second order differential equations. We will concentrate mostly on constant coefficient second order differential equations. We will derive the solutions for homogeneous differential equations and we will use the methods of undetermined coefficients and variation of parameters to solve non homogeneous differential equations.

A differential equation is a mathematical equation that relates some function with its derivatives. In applications, the functions usually represent physical quantities, the derivatives represent their rates of change, and the differential equation defines a relationship between the two.

In this section give an in depth discussion on the process used to solve homogeneous, linear, second order differential equations, $ay'' + by' + cy = 0$. We derive the characteristic polynomial and discuss how the Principle of Superposition is used to get the general solution.

Since the x in the second equation has a coefficient of 1, that would mean we would not have to divide by a number to solve for it and run the risk of having to work with fractions (YUCK). The easiest route here is to solve the second equation for x, and we definitely want to take the easy route.

Sturm-Liouville theory is a theory of a special type of second order linear ordinary differential equation. Their solutions are based on eigenvalues and corresponding eigenfunctions of linear operators defined via second-order homogeneous linear equations. The problems are identified as Sturm-Liouville Problems (SLP) and are named after J.C.F. Sturm and J. Liouville, who studied them in the ...

Introduction. Second Order Reactions are characterized by the property that their rate is proportional to the product of two reactant concentrations (or the square of one concentration).

The pseudo-first order rate equation of Lagergren has long been widely applied. In 1947, Boyd et al. developed a rate equation which considered rates of ion-exchange adsorption in the exchange adsorption of ions from aqueous solutions by organic zeolites. In the cases of diffusion through a boundary liquid film and adsorption kinetics as a chemical phenomenon, the authors concluded that a mass ...

You can put this solution on YOUR website! An ordered pair is two numbers the first of which is the x-coordinate (how far and which direction, i.e. left or right, you go to find the point on the graph horizontally) and the second is the y-coordinate (how far and in which direction, i.e. up or down, you go to find the point on the graph vertically) It is called an ordered pair because the two ...

Did You Know? A solution is a homogeneous mixture of two substances—that is, it has the same distribution of particles throughout. Technically speaking, a solution consists of a mixture of one or more solutes dissolved in a solvent. The particles of solute and solvent are molecules or ions, with one or more solvent molecules bound to each solute particle.

The Sallen-Key filter is a popular filter due to its versatility and ease of design. In this document I hope to outline the design of the filter to give an understanding of the math behind the filter design so that one can understand and build this type of filter.

derived below for the associated case. Since the Legendre differential equation is a second-order ordinary differential equation, it has two linearly independent solutions. A solution which is regular at finite points is called a Legendre function of the first kind, while a solution which is singular at is called a Legendre function of the second kind.
